Tabular Method For Epicyclic Gear Trains - YouTube

An epicyclic gear train (also known as planetary gear) consists of two gears mounted so that the center of one gear revolves around the center of the other. A carrier connects the centers of the two gears and rotates to carry one gear, called the planet gear or planet pinion, around the other, called the sun gear or sun wheel. The planet and sun gears mesh so that their pitch circles roll ...

In an epicyclic gear train, the axes of the shafts, over which the gears are mounted, move relative to a fixed axis. A simple epicyclic gear train is shown in Fig. 14.15. L where a gear A and the arm C have a common axis at O 1 about which they can rotate. The gear B meshes with gear A and has its axis on the arm O 2, about which the gear B can rotate. If the arm is fixed, the gear train is ...

Epicyclic Train Example: We use the method introduced in Epicyclic Ratio Calculation for determining the final gear ratio of an epicyclic gear train. This method is extremely methodical, which is appropriate since use of intuition is quite futile with an epicyclic gear train such as the following example.

9.9 EPICYCLIC OR PLANETARY GEAR TRAINS The conventional gear trains described in the previous sections are all one-degree-of-free-dom (DOF) devices. Another class of gear train has wide application, the epicyclic or planetary train. This is a two-DOF device. Two inputs are needed to obtain a predict-able output.
