Peripheral neuropathies are a group of disorders which affect the peripheral nervous system which have been conventionally diagnosed using electrodiagnostic studies. This study was carried out to assess the role of imaging in diagnosing peripheral mononeuropathy as exact anatomical localisation of the pathology is possible using high-resolution ultrasound and MR neurography, the modalities ...

Focal neuropathy, also known as mononeuropathy, affects a single nerve in the body, causing it to stop working properly. It most often occurs in diabetic patients, though it is the rarest of the four neuropathies that a diabetic patient may experience. Focal neuropathy occurs when one nerve stops sending information correctly between the body and the brain and can result in sudden pain and ...
