Modern psychology takes completely for granted that behavior and neural function are perfectly correlated, that one is com pletely caused by the other. There is no separate soul or life force to stick a finger into the brain now and then and make neural cells do what they would not oth--rwise. Actually, of

motor planning as well as behavioral organization. This facilitates integration and flexibility. The neural dynamic representations of particular behaviors emerge on the fly from the interplay between task and environment inputs as well as behavioral history. All behavioral states are attractors of the neural dynamics, whose

The nervous system must coordinate behavior across several timescales. A decades-old hypothesis in ethology posits that this occurs via hierarchical control. Kaplan et al. show that C. elegans employs hierarchically nested neuronal dynamics across brain and motor circuits to implement such multi-timescale behavioral organization.

Although much of the brain's functional organization is genetically predetermined, it appears that some noninnate functions can come to depend on dedicated and segregated neural tissue. In this paper, we describe a series of experiments that have investigated the neural development and organization of one such noninnate function: letter recognition.

Neural reuse theories thus differ from the usual understanding of the role of neural plasticity (which is, after all, a kind of reuse) in brain organization along the following lines: According to neural reuse, circuits can continue to acquire new uses after an initial or original function is established; the acquisition of new uses need not ...

While the term neural networks may be unfamiliar to many organizational psychologists, exciting new applications of artificial intelligence are attracting notice among organizational behavior researchers. In Neural Networks in Organizational Research: Applying Pattern Recognition to the Analysis of Organizational Behavior, authors David Scarborough and Mark Somers bring researchers, academics, and practitioners up to speed on this emerging field, in which powerful computing capabilities ...

[PMC free article] Applying a neural pattern similarity approach developed for fMRI to the analysis of simultaneous recordings from hippocampal neurons, McKenzie and colleagues provide a compelling demonstration of the hierarchical organization of rodent schema. They show that memories are organized according to behavioral relevance, such that events that occur within the same behavioral context are integrated (i.e., form a schema), while events in different behavioral contexts are ...

Neurogenetics studies the role of genetics in the development and function of the nervous system.It considers neural characteristics as phenotypes (i.e. manifestations, measurable or not, of the genetic make-up of an individual), and is mainly based on the observation that the nervous systems of individuals, even of those belonging to the same species, may not be identical.
